

ABSTRACT OF THE DISCLOSURE

A cover apparatus according to the present invention protects a protected portion including at least an opening portion of a recording medium storage chamber and a connector portion. The cover apparatus includes first and second covers. The first cover is movable between an open position where it closes the protected portion and an open position where it opens the protected portion. The second cover is located inward of the first cover, and is movable between a closed position where it closes the opening portion of the recording medium storage chamber and an open position where it opens the opening portion of the recording medium storage chamber. Also, in accordance with opening of the first cover, the second cover moves to the open position where it opens the opening portion of the recording medium storage chamber.
